Actually, this is the entirety of your input:

State officials admit that consistent lead testing when dealing with water being pumped through old lead plumbing and service connection lines is difficult. Water tested at intake or upon release from the treatment plan can be exposed to lead once it reaches those old lead connections on private property.

“The testing protocol that we have tends to offer a system-wide assessment of how water interacts with that line and home plumbing,” said Brad Wurfel, DEQ’s spokesman. “There’s a lot we unfortunately don’t know about those (home lead) levels.”

You're awesome.
 'Attempts to' not 'tends to'.

No! The system is cast iron pipes. The service lines to the homes is the part that is sometimes lead, in pre1970s construction. This is strictly about home plumbing and lead service connections to the city system. Which is private property.
