Yes, Linda,

For adult and children, it would be good to know the total n tested for adults (perhaps in the header over the charts that list the psostives), and total n tested for children, and then have a positivity rate---would be VERY useful!

Draft #2 with children 5 and under added. Case rate $[(\# \text{ confirmed} / \# \text{ tested}) \times 100 = X\%]$ might be useful?

Talked to Linda and will add a category for children 5 and under---as that is our priority group,

Lynda-- wow, thanks for taking the lead on this and translating the blood lead reports into a concise and easily understood format. I like the format.

Do the figures for high lead levels represent children with both venous and capillary testing? we know some children have not had confirmatory venous testing. can we use a term other than "high" blood lead levels, such as Increased?

Attached is our first attempt at a report format for blood testing results. We'd like this to be useful internally and also suitable for posting on the web. We've included just some basis descriptive numbers for this first attempt. We're meeting tomorrow with CLPPP staff to flesh out more details and definitions. We've included a map as a place holder, but we're not sure what exactly we'll portray here and we might put it on the back of the page (or side-by-side for a web report) so it can be larger. We've also included a place holder for a timeline to explain the significance of the dates.

Please provide comments on the format generally and more specifically on what additional data fields you'd like included each week. We anticipate adding additional information on case management and environmental investigations as we move forward.

Linda
