I agree--- with caveat's CDC jsut provided---we can't do much but to ensure that they are not drinking the water (and ingesting any other sources of lead).

FYI, that was the FASTEST response I have ever gotten out of CDC!!!

E

Great article. In box 1, lead in water is a risk factor and "blood lead testing should be performed if a single risk factor is identified at the earliest contact." So I would take this at first contact with OB, blood lead should be done and education on nutrition and vitamins, etc.

Our OB's don't know this. This need to be shared.

That is for sure, and using clean sources of water and filters...I have asked ATSDR though-

Here is the 2012 ACOG paper

I was thinking the same thing re medical removal – I can't imagine it has much efficacy – I would guess need to super emphasize prenatal vitamins with iron??

Let me check with our ATSDR doc, Mark Johnson (Boy there are a lot of Marks...)--because I wonder if the concerns for Flint beg the question. However, I have no idea what the medical removal for lead is for a pregnant women, is that chelation, and is it the same as a child? Anyway, I will follow up with him now.

I don't think anyone knows to test pregnant women.
Should we develop a separate communication to OB's?

As a secondary research project, we will be tested maternal lead at delivery and cord blood lead. But the above sounds like it should be a recommended screening???

Any lead test and level gets sent into the CLPP, from my understanding. Nancy, have you seen any uptick in pregnant women being tested out of Flint?

Eden
