

My understanding is that the other data set is by 9 Flint wards so only Flint homes are in the data set vs including those with Flint mailing addresses with zip codes. Please correct me if needed.

Subject: Re: FOR IMMEDIATE RELEASE: MDHHS releases latest data outlining blood lead levels in Flint; Follow-up care, case management resources continue for families

Hi Dr. Reynolds,

I just got done with an email with Mona---

This is a general public report that is high level--not a technical report, and was not meant to represent a technical report. This is general information--of course our surveillance program is tracking by zip, Medicaid, locality, etc.

We can discuss further what type of reporting may be useful to a technical audience---as long as not identifiable (some zips have to be suppressed) I don't see why this can't be done (probably not every two weeks like this public one would be)

Warm Regards,

Eden

This is a good start but maybe lacking context . Would GIS software identify clusters ? I am disappointed to see, at this moment , that Dr. Edward's study and Dr. Mona's study which have more granular reporting are given no credence. Is there a reason ?

MDHHS releases latest data outlining blood lead levels in Flint

Follow-up care, case management resources continue for families

LANSING, Mich. – Preliminary data indicates that 30 of 1,361 adults and children tested in Flint since October 1 had elevated blood lead levels, according to a report issued today by the Michigan Department of Health and Human Services.

This marks the first summary report on lead testing called for in the state's action plan related to health concerns about Flint's water infrastructure.

"Our goal is to help families reduce their exposure to lead sources," said Dr. Eden Wells, MDHHS chief medical executive. "We have made progress in testing and identifying those with elevated blood lead levels, and the department will continue to work closely with the Genesee County Health Department to reach these families. We will remain diligent in our ongoing outreach and education efforts."

Information comes from tests administered citywide to 1,361 children and adults since October 1. Tests showed that 21 of 969 children age 17 or younger and 9 of 392 adults over the age 18 were identified with
