Maybe the statement should be re-worded, it's confusing

Same child. Lab report is confirmation of verbal information heard last week re the 2nd test. We only have verbal information re the drop to 20 and will watch for the lab report to come through.

Under epidemiology surveillance- :

- **Second lab report received for hospitalized child in Flint who was with the very high level, confirming that his BLL had dropped from the 50s to the 30s as of the second test.**

Is this the same child referenced under the CLPPP section (nurse reports level dropped to 20?) Or is this a second child with very elevated lead level?
