Thanks, Bob. I need some time to refresh my memory so I will schedule a time later this week to go over the randomization process.

Wow, Junaid, this looks really good! I agree, I think they could use this one for a meaningful presentation.

Next week, or whenever you're available, I'd like to learn how you did this.

Thanks!
Bob

Subject: UPDATE: Flint map randomization

Martha and Bob,

Attached is a new map of EBL cases in Flint randomized by a method used by Ed Hartwick. It's better than the previous map I generated where cases were scattered at random throughout the city. In the revised map, cases were shifted slightly from their original point so some of the clustering still holds up. This is probably the final map that GCHD could use for their presentation.

Let me know if you have any questions or if you want to discuss.

Thank you,
Junaid

Subject: RE: Flint map with randomized points

I'm going to try to randomize points by City (Flint) and zip code (only zip codes in city of Flint) rather than just zip code -- perhaps the output will be better? I will get the new map out sometime tomorrow.

Subject: Flint map with randomized points

Martha and Bob,

Attached is the map of Flint with points randomized by zip code, meaning I calculated the # of cases with BLL between 5 and 9 ug/dL (inclusive) and with BLL ≥ 10 ug/dL for each zip code and plotted the same number of cases per zip code in random locations within the zip code boundary. Unfortunately, as we originally suspected, the clustering of cases depicted in the original map (also attached) is lost with this randomization.

Junaid
